How to solve a nonogram

1. The numbers beside a row, or above a column, are the lengths of the blocks of filled squares in that line, in order, from left to right or from top to bottom.
2. Between two blocks there is at least one empty square. There may be more. A line with the single clue 0 has no filled squares at all.
3. Fill the squares you have proved must be filled. Mark with a small x the squares you have proved must be empty. The x marks are what make the next deduction visible, so use them.
4. Work one line at a time and only write what the clues force. In this book you never need to guess: if a line will not move, another line will, and coming back to the first one later will always work.
5. When every square is decided, the filled squares make a picture. Its name is in the solutions section at the back.

The one move that starts almost every puzzle

If a block is longer than the room it has to slide in, part of it cannot move at all. In a line of 10 squares with the single clue 8, the block can start at square 1, 2 or 3. Whichever it is, squares 3 to 8 are filled in every case, so fill them. This is called overlap, and it is the first thing to try on any long clue.
